Exp 15: Report and Presentation on Career Pathways and the Future of Low-Code Development

Name: Suriya S | Roll No: 241401112 | Dept. of Computer Science and Engineering, Rajalakshmi Engineering College

1. Aim

To study the career pathways open to a low-code developer, to examine how low-code development is expected to change in the coming years, and to present the findings as a written report and a short slide presentation. Each finding is linked to the skills built in Experiments 1 to 14 on Zoho Creator, ending with a personal learning roadmap.

2. Procedure

2.1 Study Requirements

A career report is only useful if it connects the market to the skills a student actually has. Five activities were carried out, as listed in Table 1.

Requirement	Component	Details
Identify the roles available	Role survey	Job families that use low-code platforms, from citizen developer to solutions architect
Connect roles to coursework	Skills matrix	Skills from Experiments 1 to 14 mapped to each role
Choose credentials	Certification review	Vendor certifications for Zoho, Microsoft, Salesforce, OutSystems and Mendix
Study where the field is heading	Trend review	AI assistance, governance, pro-code extension, fusion teams
Share the findings	Slide presentation	An 8-slide deck summarising the report

Table 1: Study requirements and the components used

2.2 Career Pathways in Low-Code

Job titles differ between companies, so roles were grouped by the work they do rather than by title. Table 2 lists the main pathways. Several of them overlap, and one person often does two of them in a small team.

Role	What the role does	Core skills	Related experiments
Citizen developer	Builds small apps and automations for their own department	Form design, reports, basic workflows	4, 5
Low-code developer	Builds and maintains full business applications on a platform	Data modelling, Deluge or equivalent scripting, testing	4, 5, 6
Automation / workflow specialist	Replaces manual processes with workflows, approvals and notifications	Workflows, scheduled tasks, email and alerts	6
Integration developer	Connects the platform to other systems through APIs and connections	REST APIs, connections, authentication	7, 14
Platform administrator / governance lead	Controls users, roles, environments and security	RBAC, deployment, security and governance	8, 11, 12
Solutions architect / technical consultant	Decides what to build on low-code and what to build in code	Architecture, performance, platform limits	1, 10, 13
Business analyst / product owner	Turns business needs into app requirements and checks the result	Requirement gathering, data modelling, analytics	3, 4, 9

Role	What the role does	Core skills	Related experiments
Full-stack developer with low-code extension	Extends a platform with custom code where it falls short	Pro-code languages, custom functions, Catalyst	14

Table 2: Career pathways in low-code development

2.3 Skills Built in This Course

Each experiment trained a skill that employers ask for. Table 3 maps them.

Experiment	Skill gained	Why it matters in a job
1	Comparing low-code with traditional development	Helps decide the right approach for a project and explain it to clients
2	Platform architecture and interface	Faster onboarding to any new platform
3	Researching technology trends	Keeps skills current
4	Data modelling and form design	The foundation of every business application
5	Reports, dashboards and custom pages	Delivers the visible output that users and managers see
6	Deluge scripting, workflows, testing and debugging	Automation is the main value low-code adds
7	Connections and APIs	Real systems rarely work alone
8	User management and RBAC	Access control is required in every business app
9	AI-assisted features and analytics	AI-assisted building is becoming standard
10	Performance optimisation	Apps must still work well as data grows
11	Deployment from development to production	Safe release practice
12	Security and governance	Needed to run apps at company scale
13	Limits of low-code	Shows when low-code is the wrong tool
14	Pro-code extension	Combines low-code speed with custom code

Table 3: Skills from Experiments 1 to 14 and their career relevance

2.4 Certifications and Learning Paths

Certifications give a recognised way to prove platform skill. The paths in Table 4 were reviewed. Exam names and codes change from time to time, so the current details should be checked on each vendor's site before registering.

Platform	Example credentials	Suited to
Zoho Creator	Zoho Creator learning and certification programme	Continuing directly from this course
Microsoft Power Platform	Power Platform Fundamentals (PL-900), followed by developer or functional consultant exams	Large enterprise and Microsoft-based jobs
Salesforce	Platform App Builder	CRM-centred roles
OutSystems	Associate Developer and higher levels	Enterprise web and mobile apps
Mendix	Rapid Developer and higher levels	Enterprise app development

Table 4: Certification paths on major low-code platforms

2.5 The Future of Low-Code Development

The trends in Table 5 were identified from the trend survey in Experiment 3 and the AI features studied in Experiment 9. The effect on careers is a reasoned expectation and not a guarantee.

Trend	What is changing	Likely effect on careers
AI-assisted building	Platforms generate forms, scripts and apps from plain-language prompts	Less time on routine building, more on reviewing, testing and design
Fusion teams	Business users and professional developers build together	Communication and requirement skills gain value
Governance and security	Companies want control over apps built outside IT	Demand for administrators and governance roles
Pro-code extension	Platforms allow custom functions and external services for complex needs	Developers who know both low-code and code are the most flexible
Integration and automation	Apps connect many systems and run end-to-end processes	API and workflow skills become central
Platform lock-in and limits	Apps depend on one vendor and cannot do everything	Architects who can judge fit and risk are needed

Table 5: Trends in low-code and their effect on careers

One point stands out. Faster building does not remove the need for skill. It moves the skill from typing scripts to judging whether the generated work is correct, secure and suitable for the business.

2.6 Personal Learning Roadmap

A short plan was drawn up from the skills in Table 3 and the paths in Table 4.

Timeframe	Goal	Actions
Now	Finish this course with working projects	Complete the Gym Membership Enrollment app and keep screenshots and notes as a portfolio
Next 6 months	Earn a first credential	Choose one platform path from Table 4 and prepare for its entry-level exam
Next 6 months	Strengthen core coding	Practise a general language and REST APIs, so that custom functions and integrations are easy
1 to 2 years	Gain real project experience	Take an internship or freelance project that uses a low-code platform
1 to 2 years	Choose a direction	Move towards developer, automation, integration or architect roles

Table 6: Personal learning roadmap

3. Output

The study was presented as an 8-slide deck. Table 7 shows the content of each slide.

Slide	Title	Content
1	Title	Topic, name, roll number and department
2	Why low-code careers	Short comparison of low-code with traditional development (Experiment 1)
3	Career pathways	The eight roles from Table 2
4	Skills from this course	Highlights from Table 3
5	Certifications	The paths from Table 4
6	Future trends	The six trends from Table 5
7	My roadmap	The plan from Table 6
8	Conclusion	Key points and questions

Table 7: Slide-by-slide outline of the presentation

Observations from the output

- Low-code careers are not one job. They run from business-side citizen developers to architects who decide between low-code and custom code.
- The skills built in Experiments 4 to 8 (data modelling, reports, Deluge workflows, integrations and access control) appear in almost every role in Table 2.
- Experiments 13 and 14 showed that knowing the limits of low-code, and how to extend it with code, is itself a career skill.
- AI assistance changes the work more than it removes it. Reviewing, testing and governing apps become more important.
- Job titles vary between employers, so a skills-based roadmap is more reliable than a title-based one.
- Certification details change, so the vendor's own site should be checked before registering for any exam.

4. Result

A report on career pathways and the future of low-code development was prepared and summarised in an 8-slide presentation. Eight career roles, the skills from Experiments 1 to 14 that support them, relevant certification paths, six future trends and a personal learning roadmap were documented. This completes the requirements of this experiment.
