Exp 9: Exploring AI-Assisted Features and Built-in Analytics (Zia) in Zoho Creator

1. Aim

To explore the AI-assisted features of Zoho Creator that are provided by Zia, by checking the language model (LLM) providers that Zia can use, creating a form with the help of Zia and refining it by hand, and viewing the built-in analytics as a chart for the gym member data.

2. Procedure

2.1 Features Explored

Zia is the AI assistant of Zoho Creator. It adds GenAI-powered help across the application builder and turns data into charts without any scripting. Four areas were explored, as listed in Table 1.

Area	Component	Details
Choose the AI engine	Zia > LLM Providers	Zoho, OpenAI, Google and Anthropic are offered; Zoho is configured
Create components with AI	Zia creation menu	Form, Report, Page, Workflow and Chat Agent can be created with Zia
Create a form with AI	Form creation options	From scratch, Import with data, Using Zia, or From a template
See the data as a chart	Built-in analytics	Pie chart for the Gym member form

Table 1: AI-assisted and analytics features explored

2.2 Checking the LLM Providers

The Zia settings page lets the user integrate a preferred LLM provider so that the Zia features can run (Figure 1). It has two tabs, *LLM Providers* and *Features*. Four providers are listed, as shown in Table 2.

Provider	Status	Meaning
Zoho	Configured	Ready to use; the Zia features run on it with no extra setup
OpenAI	Configure	Not set up; can be connected by choosing Configure
Google	Configure	Not set up; can be connected by choosing Configure
Anthropic	Configure	Not set up; can be connected by choosing Configure

Table 2: LLM providers available to Zia

Since the Zoho provider was already configured, no other provider had to be connected, and the Zia features could be used directly.

2.3 Creating a Form with Zia

The creation menu at the bottom of Figure 1 shows the kinds of components that Zia can help to build: **Form, Report, Page, Workflow** and **Chat Agent**. For a form, Creator asks “How would you like to create your form?” (Figure 2) and offers these ways:

- **From scratch:** an empty form to which fields are added by dragging.
- **Import with data:** a form built from an uploaded spreadsheet, with the columns turned into fields.
- **Using Zia:** the form is described in plain words and Zia proposes the fields.
- **From a template:** ready-made forms such as Cab Booking, Conference Room Booking, Appointment Booking, Hotel Room Booking and Complaints, with more than 50 more under View More.

2.4 Reviewing and Refining the Form

The gym member form was opened in the form builder to review the fields and adjust them (Figure 3). The fields are grouped into sections, as shown in Table 3. A field that is marked with a red star is mandatory. The left panel holds the field types, including Signature, File upload, Audio, Video, Auto number, Formula and QR/Barcode, and the special fields Section, Add notes, Users and Integration. When a field or section is selected, its name and link name can be edited in the Field Properties panel on the right.

Section	Fields
Member Info	Member_Name, Age, Membership_Type
Personal Details	Email_Address, Contact_Number, Residential_Address, Emergency_Contact_Name
Membership	Membership_Plan, Preferred_Activities, Fitness_Goals_Medical_Notes

Table 3: Sections and fields of the gym member form

2.5 Built-in Analytics

The data collected through the form was shown as a pie chart without writing any code (Figure 4). A pie chart is suited to a field with a few categories, because each slice shows what share of the members falls in one category. The chart is named after the form it reads from, Gym member form, and shows three slices in different colours.

2.6 Testing the Features

Each feature was tried in the application, and Table 4 lists the cases covered and the behaviour that is expected.

Test case	Action	Expected behaviour
Provider status	Open Zia > LLM Providers	Zoho shows Configured; the other three show Configure
Creation options	Start a new form	The three own-way options and the template options are listed
Form review	Open the gym member form	Fields appear under their sections and can be edited in Field Properties
Chart	Open the pie chart	The chart renders from the form data with one slice per category

Table 4: Test cases for the Zia and analytics features

3. Output

The following figures show the Zia LLM providers, the form creation options, the gym member form in the builder and the pie chart.

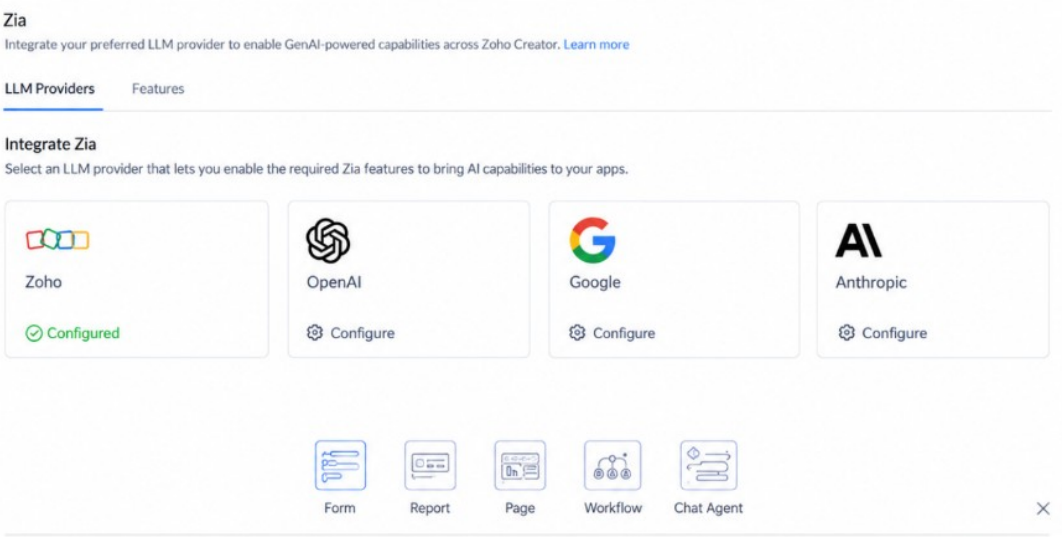

Figure 1: Zia settings with the LLM providers and the creation menu (Form, Report, Page, Workflow, Chat Agent)

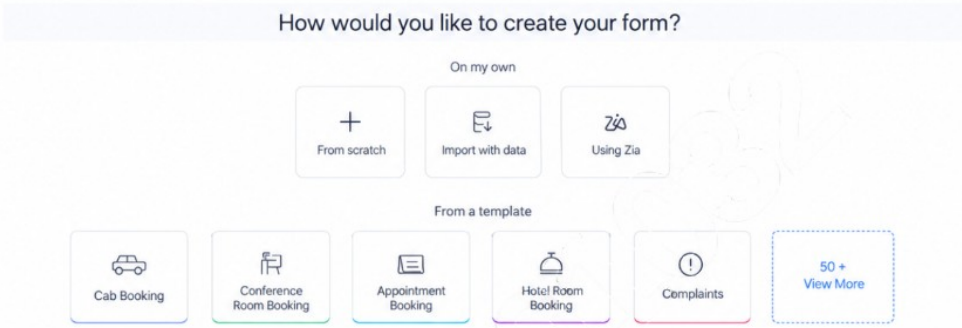

Figure 2: "How would you like to create your form?" with the Using Zia option

Figure 3: Gym member form open in the builder with its sections and Field Properties

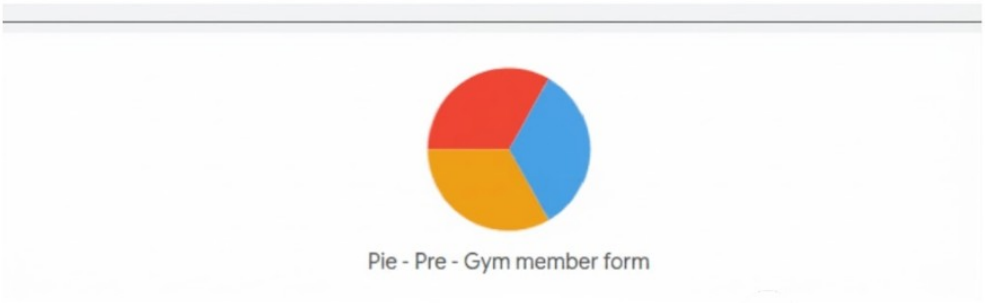

Figure 4: Pie chart for the Gym member form

Observations from the output

- Zia works with a choice of providers, and the Zoho provider is ready by default, so the AI features can be used without any API key or extra account.
- The same creation menu covers forms, reports, pages, workflows and chat agents, so AI help is available at every stage of building the application.
- Zia only speeds up the first draft, because the form still has to be reviewed and its fields checked in the builder.
- The built-in chart gives a quick picture of the data with no scripting, which saves time compared with exporting the data to a separate tool.

4. Result

The AI-assisted features of Zoho Creator were explored. The Zia LLM providers were checked with Zoho configured, the options for creating a form with Zia were reviewed, the gym member form was inspected in the builder, and the built-in analytics were shown as a pie chart. This completes the Zia and analytics requirements of this experiment.
